PIPERAZINONEPHENYLOXAZOLIDINONE DERIVATIVES AND THEIR USE AS ANTIBACTERIAL AGENTS

The present invention relates to antibiotic compounds, and in particular to antibiotic compounds containing both piperazinone and oxazolidinone rings. This invention
5 further relates to processes for their preparation, to intermediates useful in their preparation, to their use as therapeutic agents and to pharmaceutical compositions containing them.

The international microbiological community continues to express serious concern that the evolution of antibiotic resistance could result in strains against which currently available antibacterial agents will be ineffective. In general, bacterial pathogens may be
10 classified as either Gram-positive or Gram-negative pathogens. Antibiotic compounds with effective activity against both Gram-positive and Gram-negative pathogens are generally regarded as having a broad spectrum of activity. The compounds of the present invention are regarded primarily as effective against Gram-positive pathogens because of their particularly good activity against such pathogens.

15 Gram-positive pathogens, for example Staphylococci, Enterococci, Streptococci and mycobacteria, are particularly important because of the development of resistant strains which are both difficult to treat and difficult to eradicate from the hospital environment once established. Examples of such strains are methicillin-resistant staphylococcus (MRSA), methicillin resistant coagulase negative staphylococci (MRCNS), penicillin resistant
20 Streptococcus pneumoniae and multiply resistant Enterococcus faecium.

The major clinically effective antibiotic for treatment of such resistant Gram-positive pathogens is vancomycin. Vancomycin is a glycopeptide and is associated with nephrotoxicity and ototoxicity. Furthermore, and most importantly, antibacterial resistance to vancomycin and other glycopeptides is also appearing. This resistance is
25 increasing at a steady rate rendering these agents less and less effective in the treatment of Gram-positive pathogens.

The present inventors have discovered a class of antibiotic compounds containing an oxazolidinone ring which has useful activity against Gram-positive pathogens including MRSA and MRCNS and, in particular, against various strains exhibiting resistance to
30 vancomycin and against E. faecium strains resistant to both aminoglycosides and clinically used β -lactams.

We have now discovered a narrow range of compounds that is not suggested by the art and which has good activity against a broad range of Gram-positive pathogens including organisms known to be resistant to most commonly used antibiotics. In comparison with compounds described in the art (for example Walter A. Gregory et al in J. Med. Chem. 1990, 33, 2569-2578 and Chung-Ho Park et al in J. Med. Chem. 1992, 35, 1156-1165) the compounds also possess a favourable toxicological profile.

Accordingly, the present invention provides a compound of the formula (I):

10 Furthermore, some compounds of the formula (I) may have other chiral centres.

It is to be understood that certain compounds of the formula I can exist in solvated as well as unsolvated form such as, for example, hydrated forms. It is to be understood that the invention encompasses all such solvated forms which possess antibacterial activity.

15 In a further aspect the present invention provides a process for preparing a compound of the formula (I) or a pharmaceutically-acceptable salt thereof. The compounds of the formula (I) may be prepared by deprotecting a compound of the formula (II):

(II)

It will be understood that these examples are not exhaustive. Where specific examples of methods for the removal of protecting groups are given below these are similarly not exhaustive. The use of protecting groups and methods of deprotection not specifically mentioned is of course within the scope of the invention.

A carboxy protecting group may be the residue of an ester-forming aliphatic or araliphatic alcohol or of an ester-forming silanol (the said alcohol or silanol preferably containing 1-20 carbon atoms).

Methods appropriate for removal of hydroxy and amino protecting groups include, for example, acid-, metal- or enzymically-catalysed hydrolysis, for groups such as o-nitrobenzyloxycarbonyl, photolysis and for groups such as silyl groups, fluoride.

Aralkoxymethyl, groups may be introduced onto the amide group by reacting the latter group with the appropriate aralkoxymethyl chloride, and removed by catalytic hydrogenation. Alkoxymethyl, tri alkyl/arylsilyl and tri alkyl/silyl groups may be introduced by reacting the amide with the appropriate chloride and removing with acid, or in the case of the silyl containing groups fluoride ions. The alkoxyphenyl and alkoxybenzyl groups are conveniently introduced by arylation or alkylation with an appropriate halide and removed by oxidation with ceric ammonium nitrate. Finally alk-1-enyl groups may be introduced by reacting the amide with the appropriate aldehyde and removed with acid.

For further examples of protecting groups see one of the many general texts on the subject, for example, 'Protective Groups in Organic Synthesis' by Theodora Green (publisher: John Wiley & Sons).

In another aspect of the present invention the compounds of the formulae (I) and (II) and pharmaceutically-acceptable salts thereof can be prepared :-

- a) by modifying a substituent in, or introducing a substituent into, another compound of the formula (I);
- b) when R^1 is of the formula - $NHS(O)_n(1-4C)alkyl$, wherein n is 1 or 2; by oxidising a compound of the formula (I) wherein n is 0 or, when n is 2 by oxidising a compound of the formula (I) wherein n is 1;

- c) when R^1 is of the formula $-NHC(=O)(1-4C)alkyl$ or $-NHS(O)_n(1-4C)alkyl$, by reacting a compound of the formula (III) with a compound of the formula (IV):

(III)

(IV)

- d) when R^1 is hydroxy, by reacting a compound of the formula (V) with a compound of the formula (VI):

(V)

(VI)

e) when R^1 or R^{10} is of the formula $-NHC(=O)(1-4C)alkyl$, the reaction of a compound of the formula (I) or (II) wherein R^1 or R^{10} is hydroxy, with an amide of the formula (VII):

(VII)

wherein R^2-R^4 , R^{10} and R^{11} are as hereinabove defined,

R^{12} is of the formula $-C(=O)(1-4C)alkyl$ or $-S(O)_n(1-4C)alkyl$,

R^{13} is (1-6C)alkyl or benzyl, R^{14} is (1-6C)alkyl and L^1 is a leaving group;

and thereafter if necessary: i) removing any protecting groups;

5 ii) forming a pharmaceutically-acceptable salt.

Methods for converting substituents into other substituents are known in the art. For example an alkylthio group may be oxidised to an alkylsulphinyl or alkylsulphonyl group, a cyano group reduced to an amino group, a nitro group reduced to an amino group, a hydroxy group alkylated to a methoxy group, or a bromo group converted to an alkylthio group.

Compounds of the formula (I) or (II) wherein R^1 or R^{10} is $-NHS(O)_n(1-4C)alkyl$ can be prepared by oxidising a compound of the formula (I) or (II) with standard reagents known in the art for the oxidation of a thio group to a sulphinyl or sulphonyl group. For example, a thio group may be oxidised to a sulphinyl group with a peracid such as m-chloroperoxybenzoic acid and oxidising agents such as potassium permanganate will convert a thio group to a sulphonyl group. Compounds of the formula (I) or (II) wherein R^1 or R^{10} is $-NHS(1-4C)alkyl$ can be prepared by reacting compounds of the formula (III) with a reagent such as (1-4C)alkylSCl.

Standard reaction conditions for the acetylation of an amine group in a compound of the formula (III) or its conversion to a sulphonamido group are known in the art. For example, the amino group can be acetylated to give an acetamido group using the Schotten-Baumann

procedure; reacting the compound of the formula (III) with acetic anhydride in aqueous sodium hydroxide and THF in a temperature range of 0° to 60°C, preferably between 0°C and ambient temperature. Preferably the acylation is carried out in situ following the catalytic hydrogenation of a compound of the formula (IIIA) (below), by performing the hydrogenation in the presence
5 of acetic anhydride.

A compound of the formula (III) could for example be converted to a compound of the formula (I) or (II) wherein R¹ or R¹⁰ is (1-4C)SO₂NH- by reacting the compound of the formula (III) with a sulphonyl chloride. For example, by reacting the compound of the formula (III) with mesyl chloride in a mild base such as pyridine.

10 Alternatively compounds of the formula (I) or (II) wherein R¹ or R¹⁰ is (1-4C)alkylSO₂NH- or (1-4C)alkylSONH- may be prepared by reacting a compound of the formula (III) with a compound of the formula (IV) wherein L¹ is a phthalimido group, or preferably L¹ is halo, for example chloro.

The compound of the formula (IV) wherein L¹ is phthalimido may be prepared by
15 oxidising a compound of the formula (IVA):

(IVA)

with standard oxidising agents known for the conversion of a thio group to a sulphinyl or sulphonyl group. Compounds of the formula (IVA) can be prepared by reacting phthalimide
20 with an alkylthiohalide, preferably the alkylthiochloride ((1-4C)alkylSCl).

A compound of the formula (III) may be prepared by reducing a compound of the formula (IIIA):

(IIIA)

5 wherein R^2 - R^4 and R^{11} are as hereinabove defined.

Suitable reducing agents include triethylamine/hydrogen sulphide, triphenylphosphine or phosphite ester, or hydrogen in the presence of a catalyst. More specifically a compound of the formula (IIIA) may be converted to a compound of the formula (III) by heating it in an aprotic solvent, such as 1,2-dimethoxyethane, in the presence of $P(OMe)_3$ and subsequently heating in 6N aqueous hydrochloric acid, or reacting it with hydrogen in the presence of palladium on carbon in an aprotic solvent such as DMF or ethyl acetate. For further details on the reduction of azides to amines see USP 4,705,799. A compound of the formula (IIIA) may be reduced and converted to a compound of the formula (I) or (II) *in situ* using acetic anhydride in DMF.

15 A compound of the formula (IIIA) may be prepared by reacting a compound of the formula (IIIB):

(IIIB)

20 wherein R^{15} is mesyloxy or tosyloxy, with a source of azide. For example, by reacting (IIIB) with sodium azide in an inert solvent such as DMF in a temperature range of ambient to 100°C , normally in the region of 75°C - 85°C . A compound of the formula (IIIB) may be prepared by converting the hydroxy group in a compound of the formula (I) or (II) wherein R^1 or R^{10} is hydroxy into a tosyloxy or mesyloxy group by standard methods known in the art. For example,

by reacting said hydroxy compound of the formula (I) or (II) with tosyl chloride or mesyl chloride in the presence of a mild base such as triethylamine.

Alternatively, a compound of the formula (III) may be prepared using similar processes to those used hereinabove and hereinafter for the preparation of compounds of the formulae (I) and (II).

Compounds of the formulae (V) and (VI) are conveniently reacted together in the presence of a strong base such as butyl lithium, lithium hexamethyldisilazide, lithium *tert*-butoxide, or lithium diisopropylamide. The reaction is conveniently carried out in an inert solvent such as tetrahydrofuran (THF), dimethylformamide (DMF), *N,N*-dimethylpropyleneurea (DMPU) or *N*-methylpyrrolidone in a temperature range of -78°C to -50°C for the deprotonation and cyclisation. Suitable values for R¹³ include ethyl and benzyl and suitable values for R¹⁴ include ethyl and *n*-propyl, preferably *n*-propyl.

A compound of the formula (V) is conveniently prepared by reacting a chloroformate of the formula (ClCOOR¹³) with a compound of the formula (VA):

(VA)

wherein R²-R⁴ and R¹¹ are as hereinabove defined. The reaction is conveniently carried out in the presence of an inorganic or organic base such as sodium bicarbonate or an amine base such as dimethylaniline, the former in a solvent such as acetone/water and the latter in an organic solvent such as THF, toluene, DMF or acetonitrile.

A compound of the formula (VA) may be prepared by reducing a compound of the formula (VB):

(VB)

5 wherein R^2 - R^4 and R^{11} are as hereinabove defined.

Many reduction methods suitable for the reduction of a nitro to an amino group are known in the art, for example catalytic hydrogenation and metal reductions. Suitable catalysts in catalytic hydrogenation include Raney nickel, platinum metal and its oxide, rhodium, palladium-on-charcoal and Wilkinson's catalyst $RhCl (Ph_3P)_3$. Catalytic hydrogenation is
 10 conveniently carried out in the temperature range $0^\circ C - 150^\circ C$, but preferably at ambient temperature at slightly above atmospheric pressure.

A compound of the formula (VB) is conveniently prepared by reacting together compounds of the formulae (VC) and (VD):

(VC)

(VD)

wherein R^2 - R^4 and R^{11} are as hereinabove defined and L^2 is a leaving group, preferably halo and in particular fluoro.

The reaction between compounds of the formulae (VC) and (VD) is carried out in the presence of an organic or inorganic base such as sodium bicarbonate, potassium carbonate or an amine base such as diisopropylethylamine, in an inert solvent such as acetonitrile, DMF, DMPU or N-methylpyrrolidone, in a temperature range of 50°C - 150°C.

Compounds of the formula (VD) may be prepared by introducing R^{11} into a compound of the formula (VE):

(VE)

wherein R^{16} is a protecting group, and subsequently removing R^{16} (deprotecting). Preferably R^{16} is *tert*-butoxycarbonyl.

For example, when R^{11} is a substituted or unsubstituted alkyl group, the compound of the formula (VE) may be reacted with R^{11} - L^3 wherein L^3 is a leaving group, in particular tosylate or halo in the presence of a strong base. Suitable bases include sodium hydroxide, lithium diisopropylamide, butyllithium and potassium butoxide. The reaction is usually performed in an inert solvent such as THF or DMF in a temperature range of 0°C - 100°C.

Alternatively, when R^{11} is alkyl substituted by an electronegative group, R^{11} may be introduced into the compound of the formula (VE) by reacting it with the related alkene. The compound of the formula (VD) wherein R^{11} is 2-hydroxyethyl may be prepared by heating the compound of the formula (VE) with ethylene oxide in the temperature range of 40°C - 100°C.

It may be synthetically simpler to prepare some compounds of the formula (VD) by introducing a substituent onto the unsubstituted ring nitrogen in the compound of the formula (VE) which could subsequently be converted into the desired R^{11} . For example,

2-cyanoethyl could be introduced onto the ring nitrogen, and reduced to an amino group which itself could be alkylated to alkylamino.

The reaction of a compound of the formula (I) or (II) wherein R^1 or R^{10} is hydroxy with an amide of the formula (VII) is conveniently carried out in the presence of tri-n-butylphosphine and 1,1'-(azodicarbonyl)dipiperidine in an organic solvent such as THF, and in the temperature range $0^\circ - 60^\circ\text{C}$, but preferably at ambient temperature. Details of analogous Mitsunobu reactions are contained in Tsunoda et al, Tet.Letts., 34, 1639, (1993). Amides of the formula (VII) may be prepared by standard procedures of organic chemistry which are within the ordinary skill of an organic chemist.

10 When an optically active form of a compound of the formula (I) is required, it may be obtained, by carrying out one of the above procedures using an optically active starting material or by resolution of a racemic form of the compound or intermediate using a standard procedure.

The (5R)-5-azidomethyl-3-(3-fluoro-4-{4-(2-fluoroethyl)-3-oxopiperazin-1-yl}phenyl)oxazolidin-2-one used as starting material was prepared as follows :-

1-*tert*-Butoxycarbonyl-3-oxopiperazine (21.6g) was dissolved in dry DMF (500 ml) and
10 potassium *tert*-butoxide (24.2g) was added. The mixture was stirred at ambient temperature for 30 minutes, then 1-(4-methylphenylsulfonyloxy)-2-fluoroethane (see J.Med.Chem. (1980), 23(9), 985-90 for outline of synthesis, 25.9g) added, and stirring continued at the same temperature for 24 hours. Solvent was evaporated, and the residue partitioned between ethyl acetate and water. The organic layer was washed with water and evaporated.
15 The residue was dissolved in isopropanol and diluted with iso-hexane, precipitating unchanged piperazinone starting material, which was removed by filtration. The solution was chromatographed on silica, using as eluant a gradient increasing in polarity from 0 to 50% isopropanol in iso-hexane. Relevant fractions were combined and evaporated to give 1-*tert*-butoxycarbonyl-4-(2-fluoroethyl)-3-oxopiperazine (6.74g).

MS (CI): 247 (MH⁺).

NMR (CDCl₃) δ : 1.49 (s, 9H); 3.50 (t, 2H); 3.66 (overlapping m, 3H); 3.77 (t, 1H); 4.11 (s, 2H); 4.53 (t, 1H); 4.72 (t, 1H).

1-*t*-Butoxycarbonyl-4-(2-fluoroethyl)-3-oxopiperazine (6.65g) was dissolved in dichloromethane (500 ml), cooled in an ice-bath, and trifluoroacetic acid (150 ml) added. The mixture was stirred at the same temperature for 2 hours. Solvent was evaporated to yield crude product, which was dissolved in the minimum volume of ethyl acetate. Slow
30 addition of diethyl ether caused precipitation of 1-(2-fluoroethyl)-2-oxopiperazine product as the mono trifluoroacetic acid salt (6.19g).

MS (CI): 147 (MH^+).

NMR (DMSO- D_6 + $\text{CD}_3\text{CO}_2\text{H}$) δ : 3.44 (t, 2H); 3.63 (t overlapping m, 3H); 3.76 (t, 1H); 3.81 (s, 2H); 4.50 (t, 1H); 4.69 (t, 1H).

1-(2-Fluoroethyl)-2-oxopiperazine trifluoroacetate (6.1g) was dissolved in acetonitrile (100 ml). *N,N*-Diisopropylethylamine (13 ml) was added to the mixture, followed by 3,4-difluoronitrobenzene (3.39g), and the mixture heated to reflux for 18 hours. Solvent was evaporated, and the residue chromatographed on silica, using as eluant a gradient increasing in polarity from 0 to 4% methanol in dichloromethane. Relevant fractions were combined and evaporated to give 3-fluoro-4-(4-{2-fluoroethyl}-3-oxopiperazin-1-yl)nitrobenzene product as a solid (4.4g).

MS (Electrospray): 286 (MH^+).

NMR (CDCl_3) δ : 3.67 (s, 4H); 3.72 (t, 1H); 3.83 (t, 1H); 4.02 (s, 2H); 4.58 (t, 1H); 4.76 (t, 1H); 6.91 (t, 1H); 7.96 (dd, 1H); 8.02 (dm, 1H).

3-Fluoro-4-(4-{2-fluoroethyl}-3-oxopiperazin-1-yl)nitrobenzene (4.35g) was dissolved in a mixture of ethyl acetate (250 ml) and DMF (5 ml), and the solution flushed with argon. Palladium (10% on carbon, 200mg) was added, and the mixture hydrogenated under ambient pressure. After gas uptake had ceased, the mixture was filtered through celite and solvent evaporated. The residue was taken up in ethyl acetate, washed twice with water, dried (MgSO_4), and evaporated, to give 5-amino-2-(4-{2-fluoroethyl}-3-oxopiperazin-1-yl)fluorobenzene product, which was used without further purification.

MS (Electrospray): 256 (MH^+).

5-Amino-2-(4-{2-fluoroethyl}-3-oxopiperazin-1-yl)fluorobenzene (2.6g) was dissolved in dry dichloromethane (50 ml) under argon. Pyridine (1.03 ml) was added, and the mixture cooled to -20°C. Benzyl chloroformate (1.6 ml) was added, and the mixture stirred for 10 minutes at -20°C, before allowing the temperature to rise to ambient over 1.5 hours.

5 Solvents were evaporated, the residue dissolved in dichloromethane and washed with sodium bicarbonate solution. After drying (MgSO₄) and evaporation of solvent, the residue was chromatographed on silica, using as eluant a gradient increasing in polarity from 0 to 5% methanol in dichloromethane. A solution of lithium *tert*-butoxide was prepared by addition of *n*-butyllithium (1.6 M in hexane, 2.9 ml) to a stirred solution of *tert*-butanol (0.43g) in anhydrous THF (10 ml) at -10°C under argon. After cooling to -70°C, a solution of 5-benzyloxycarbonylamino-2-(4-{2-fluoroethyl}-3-oxopiperazin-1-yl)fluorobenzene (1.5g) in dry THF (15 ml) was added. After 10 minutes, (R)-glycidylbutyrate (0.67g) in dry THF (15 ml) was added to the resulting mixture, and stirring continued at -70°C for 15 minutes, before allowing the temperature to rise to ambient over 16 hours. Methanol (10 ml) was added, followed by saturated sodium bicarbonate solution (20 ml) and water (10 ml). The organics were extracted into ethyl acetate (3 x 25 ml), washed with brine and dried (MgSO₄). Solvent was evaporated and the residue purified by chromatography on silica, using as eluant a gradient increasing in polarity from 0 to 3% methanol in dichloromethane. Relevant fractions were combined and evaporated to give (5R)-3-(3-fluoro-4-{4-(2-fluoroethyl)-3-oxopiperazin-1-yl}phenyl)-5-hydroxymethylloxazolidin-2-one (1.07g).
